MODEL GF-9191H GF-9191E GF-9191HB

In the interests of user-safety the set should be restored to its original condition and only parts identical to those specified be used.

SPECIFICATIONS

GENERAL

Type:

Portable stereophonic cassette tape recorder with built-in LW/MW/SW/FM 4-band radio

Power source:

AC 110/220/240V, 50/60 Hz (GF-9191H/HB)

AC 240V, 50/60 Hz (GF-9191E)

DC 15V (Ten UM/SUM-1, R20, "D" size, HP2 batteries or External DC supply)

35 W

Power consumption:

Speaker:
16 cm (Woofer) x 2,
5 cm (Tweeter) x 2

Power output:

MPO 13W (6.5W+6.5W) (DIN45 324)
(GF-9191H/HB)

Dynamic Power 19W (9.5W+9.5W)
(GF-9191E)

AC Operation

6-IC (Integrated Circuit), 34-transistor and 30-diode (3-Light Emitting Diode)

516mm(W) x 115mm(D) x 271mm(H)

6.5 kg (without batteries)

Semiconductors:

1 EXT. MIC. 600 ohms (J101-A, J101-C)

Dimensions:

2 Mixing mic. 600 ohms (J401)

Weight:

3 Remote control (J101-B)

Input terminals:

4 EXT. DC power (J901)

5 AC input power (SO901)

6 REC/PB DIN socket, 2.5 mV/10 K ohms (SO101)

7 FM EXT. antenna (TB1)

8 PHONO (J103-A, J103-B)

Output terminals:

- 1 EXT. speaker, 4 ~ 8 ohms (SO102, SO103)
- 2 PHONES, 4 ~ 8 ohms (J603)
- 3 REC/PB DIN socket, 0.7 V/50 K ohms (SO101)

TAPE RECORDER SECTION

Type:

4-track stereo cassette tape recorder

Philips type compact cassette tape

4.8 cm/sec.

AC bias

AC erasing

60 minutes (with C-60 tape)

Fast forward or
rewind time: 120 sec. (with C-60 tape)

Frequency response: 40 ~ 15,000 Hz (CrO₂ tape)

40 ~ 12,000 Hz (Normal tape)

0.25% (DIN45 511) (GF-9191H/HB)

0.2% (WRMS) (GF-9191E)

50 dB

RADIO SECTION

Frequency range:

LW 150 ~ 285 kHz

MW 520 ~ 1,620 kHz

SW 5.95 ~ 18 MHz

FM 87.6 ~ 108 MHz

Intermediate frequency:

LW/MW/SW 455 kHz

FM 10.7 MHz

4-band superheterodyne system

LW/MW ferrite core bar antenna

SW/FM telescopic antenna

FM EXT. antenna

NAMES OF PARTS

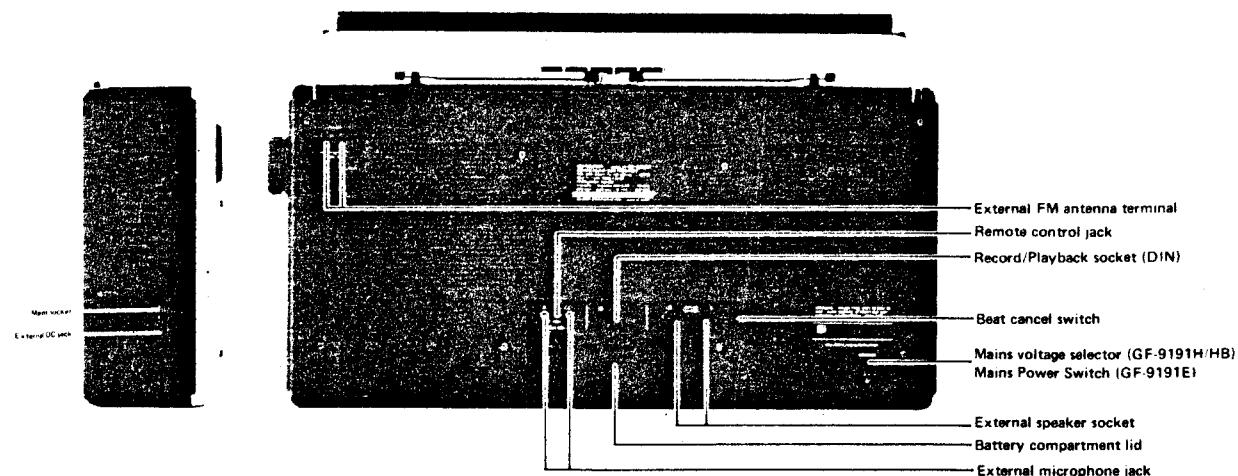

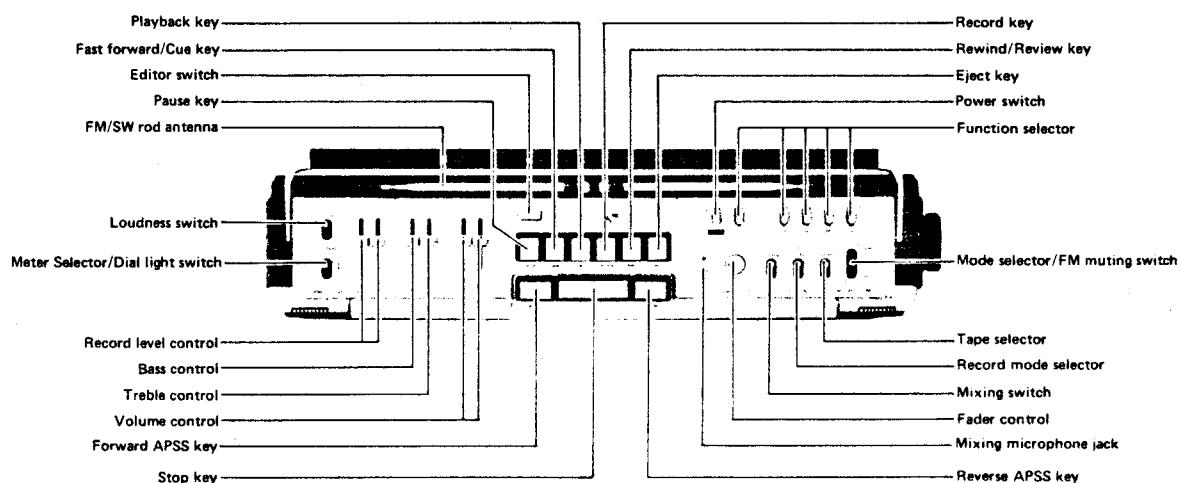

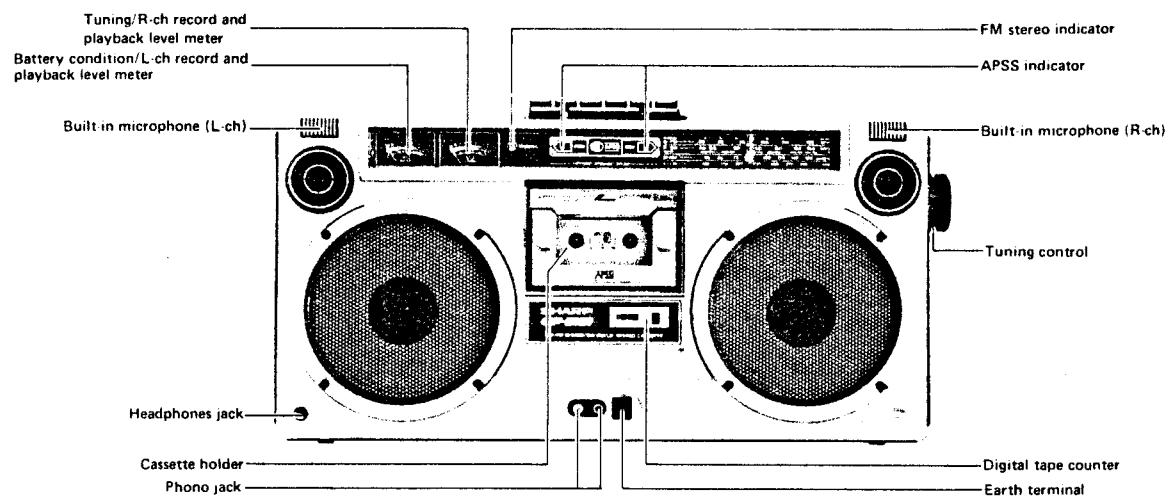

Figure 1

DISASSEMBLY

A **FRONT CABINET REMOVAL** (Refer to Figures 2 and 3)

1. Pull out the power cord plug or adaptor plug from the unit.
2. Take out the cassette tape from the cassette holder.
3. Remove eight (8) screws retaining the front cabinet.
4. Open the battery compartment cover and remove one (1) screw retaining the front cabinet. (GF-9191E only).
5. Gently pull out the front cabinet and disconnect four (4) tips (Speaker) connected to the main P.W. board.

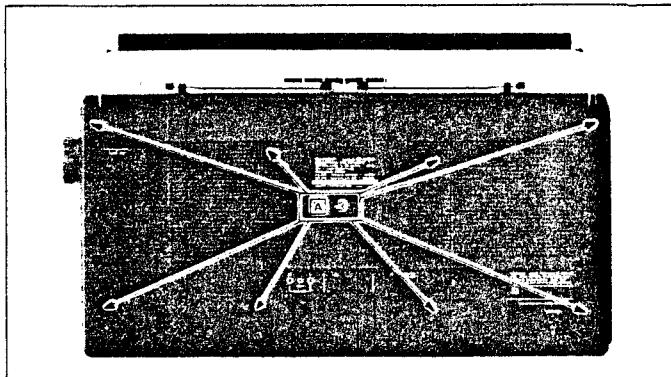

Figure 2

B **OPERATION PANEL REMOVAL** (Refer to Figure 3)

1. Remove the front cabinet as described in front cabinet removal.
2. Remove seven (7) knobs (RECORD LEVEL, BASS, TREBLE, VOLUME and FADER).
3. Gently lift up the operation panel from the back cabinet.

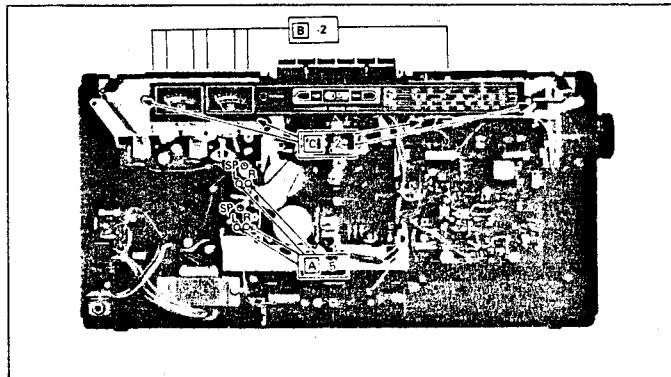

Figure 3

C **DIAL SCALE PLATE REMOVAL** (Refer to Figure 3)

1. Remove the operation panel as described in operation panel removal.
2. Remove four (4) screws retaining the dial scale plate.
3. Gently pull out the dial scale plate from the chassis.

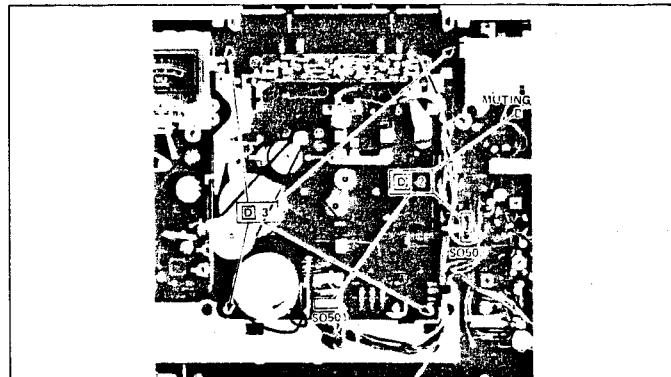

Figure 4

E **PHONO JACK PLATE REMOVAL** (Refer to Figure 5)

1. Remove the mechanism block as described in mechanism block removal.
2. Remove two (2) screws retaining the phono jack plate.
3. Gently pull out the phono jack plate from the back cabinet.

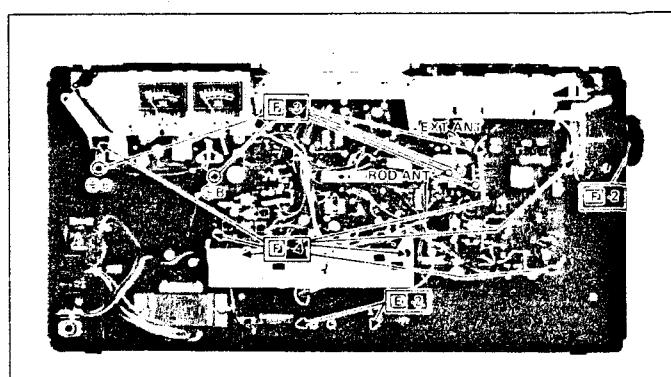

Figure 5

VOLTAGE SELECTION (GF-9191H/HB only)

Before operating the unit on mains, check the pre-set voltage. If the voltage is different from your local voltage, adjust the voltage as follows: Rotate the plug of the voltage selector by using a screwdriver so that your local voltage can be seen. (Refer to Figure 6)

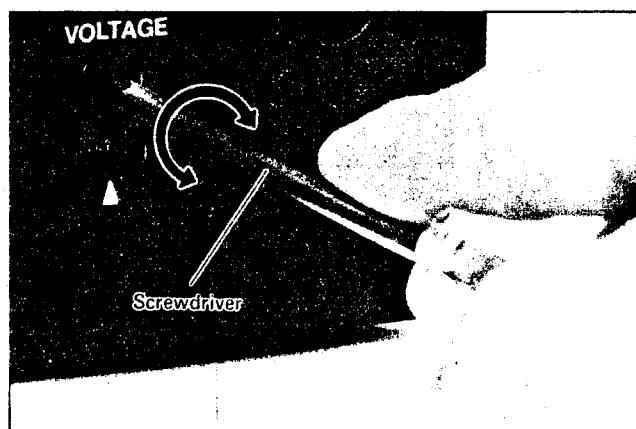

Figure 6

DIAL CORD STRINGING

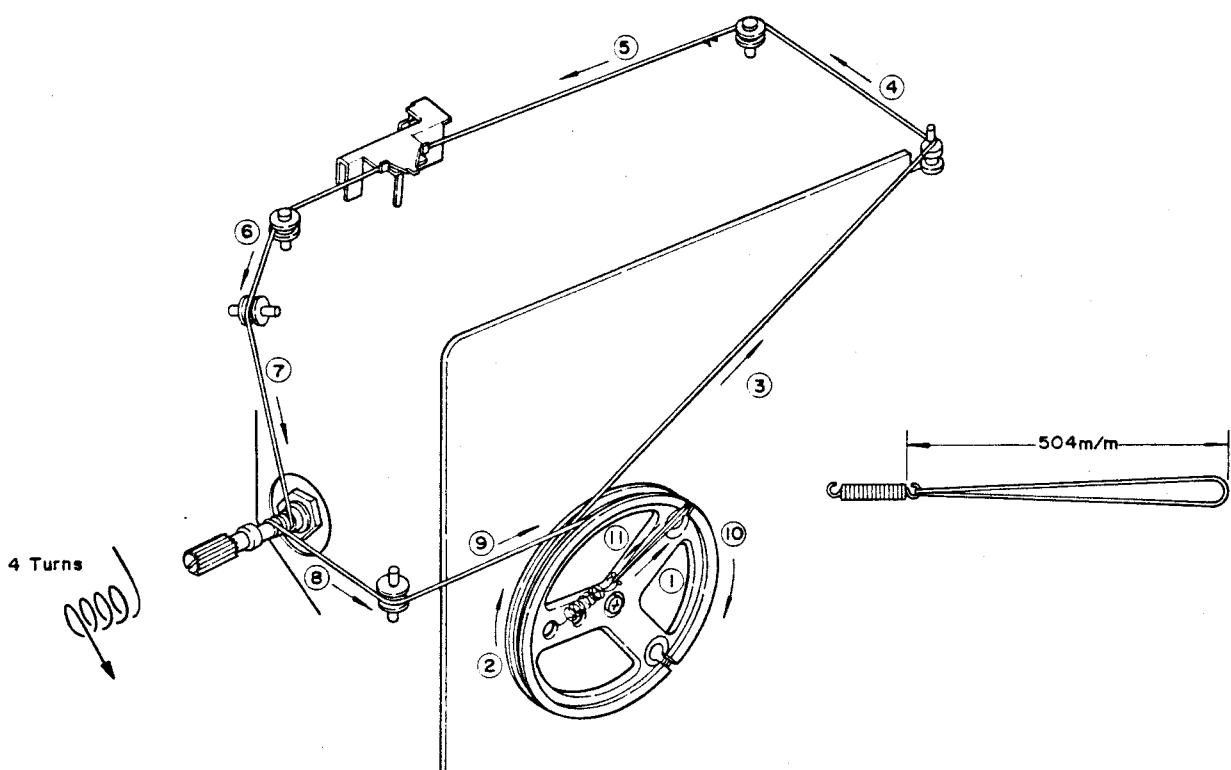

Figure 7

APSS DETECTION CIRCUIT

(Refer to Figures 10, 11 and 12)

The current fed to the APSS detection circuit drives the tape playback signal given from the record/playback head into the APSS pre-amp (IC701) through the equalizer amp (Q101 to Q104), turning "ON" the Q701, and now the signal is amplified to exceed VBE (voltage between base and emitter) and charges the C706 up to +15 volts.

Next, when the Q702 is turned "ON", the Q703 is turned "OFF", and the potential of the Q703 collector stabilizes at +15 volts. Therefore the Q704 is not turned "ON", in consequence, neither is the Q705. As a result, the plunger is not actuated. In other words, as far as the tape carries signals, the plunger does not work, that is, the tape is continuously fast forwarded according to the mechanism of the APSS. Meanwhile, when there is no signal on the

tape, the potential, even if amplified by the equalizer amp (Q101 to Q104) and APSS pre-amp (IC701), becomes lower than VBE of Q701, which, therefore, is turned "OFF", and the electric charge of C706 (determined by the value of R706 and C706) is discharged at the time constant. When the potential of C706 is discharged to be below VBE of Q702, the Q702 is turned "OFF" and the Q703 is activated. Therefore, the collector potential of Q703 becomes zero (0) volt and, consequently, the +15 volt voltage passes through the R711, allowing a discharge current to flow towards the C707. By this discharge current, the potential of the Q704 base drops momentarily to zero (0) volt, and the Q704 is turned "ON".

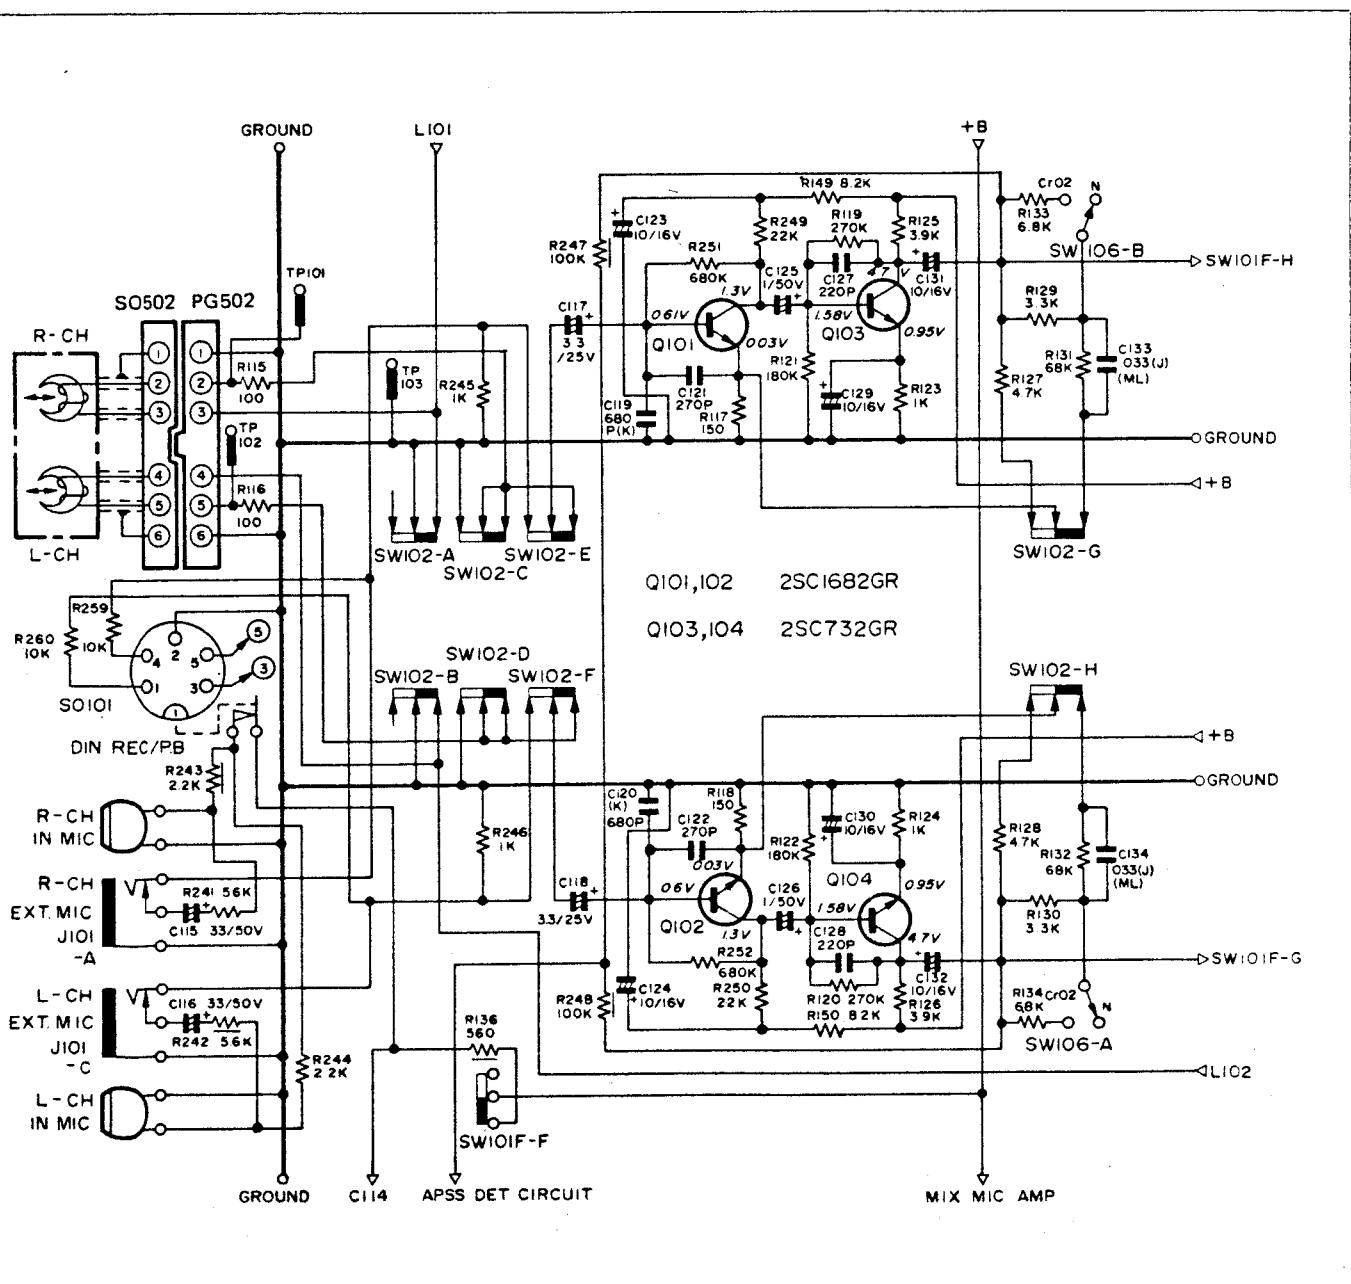

Figure 10 EQ AMP.

Accordingly, the potential of the C707 is permitted to be stabilized from zero (0) volt to +15 volts. When the potential exceeds VBE, the Q704 is turned "OFF". Then the Q704 is turned "ON", and +B is supplied to the base of Q705 through the R712, turning "ON" the Q705. Then, an end of the plunger is grounded and +15V is applied to the plunger, which, in turn, is actuated. When the Q704 is turned "OFF", the Q705 is also turned "OFF", cutting off the potential to the plunger. When the plunger is put in action, the APSS lockplate is stretched out to release the FWD-APSS key. Consequently, the FWD-APSS switch (SW503) is turned "OFF" and the pinch roller is pressed hard against the flywheel shaft. Moreover, the fastforwarding gear is disengaged from the gear of the takeup turntable, setting the unit in normal playback mode again. As the FWD-APSS switch (SW503) is turned "OFF", the light emitting diode of D505 stops flickering and the APSS limiter circuit is made inactive. Further, the muting circuit of Q112 also stops its function.

In the meantime, when the REV-APSS key is depressed the fast-forwarding gear meshes with the gear of supply turntable and the REV-APSS switch (SW502) is turned "ON" to set the tape in rewind mode, permitting the light emitting diode of D504 to flicker. The successive function is just as in the case of FWD-APSS behavior. This ends the explanation of the APSS performance.

Note However, that the APSS may malfunction when either one of following recordings is played back, but, remember, this is not a trouble.

1. A prolonged portion of pianissimo in music.
2. A blank portion in the midst of music (more than 3 seconds when measured in playback).
 - * In cases 1 & 2 the FWD-APSS or REV-APSS key, if depressed, resets itself and regular playback mode is resumed.
3. A too short interval between programs (about 1 second when measured in playback).
4. A noisy hum or buzz recorded in a blank portion.
 - * In cases 3 & 4 the condition doesn't allow the APSS circuit to work easily, and the blank portion couldn't be detected.
5. FWD-APSS key depressed within 10 seconds (as measured in playback) from the end of a preceding selection.
6. REV-APSS key depressed within 10 seconds (as measured in playback) from the beginning of a selection.
 - * In cases 5 & 6 the tape runs 10 or 30 times as fast as in playback mode if the FWD-APSS or REV-APSS key is depressed, therefore the tape skips a blank portion while the key is being depressed.

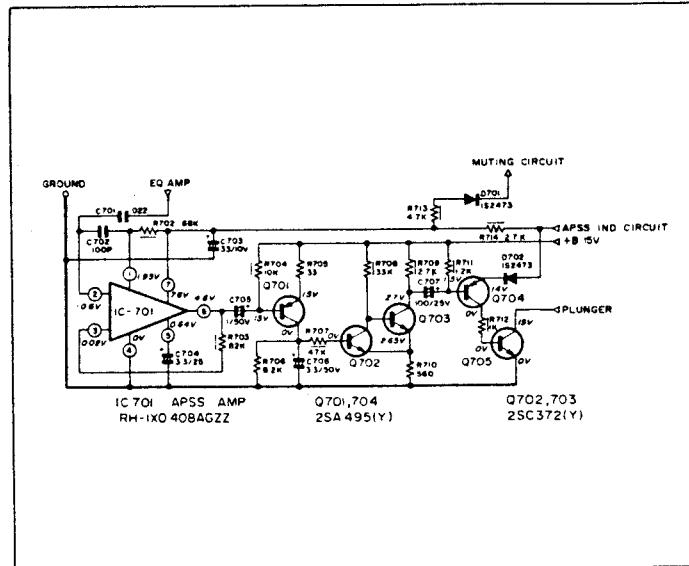

Figure 11 APSS DETECTION CIRCUIT

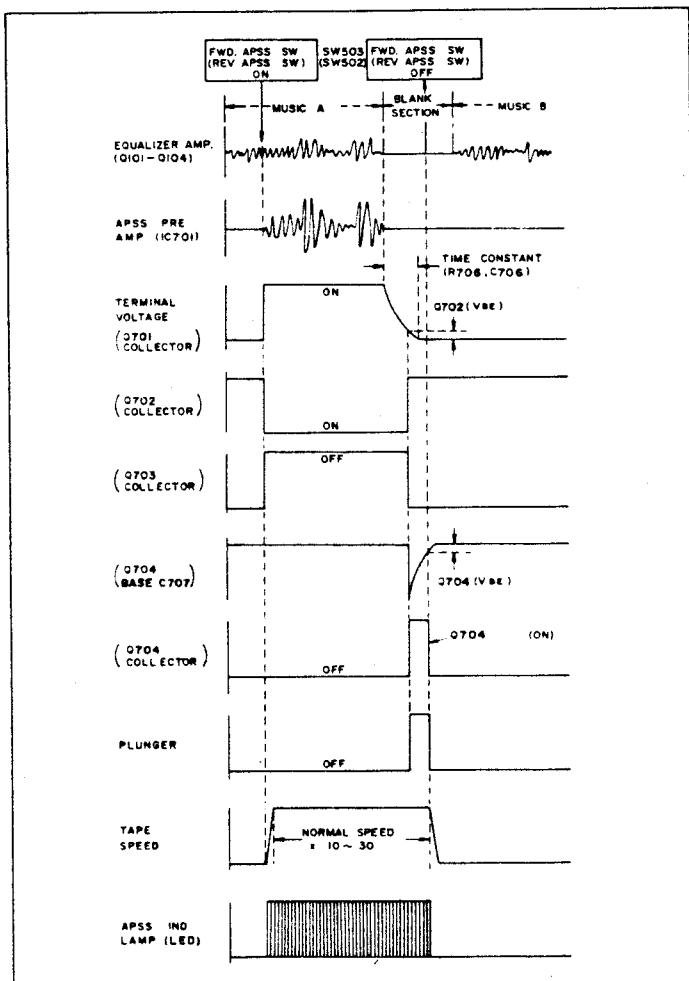

Figure 12 APSS MOVEMENT PRINCIPLE

MECHANICAL ADJUSTMENT

■ FLYWHEEL THRUST CLEARANCE ADJUSTMENT

(Refer to Figure 13)

1. Slowly rotate the flywheel thrust clearance adjusting screw clockwise until there will be no thrust clearance.
2. Next, rotate the thrust clearance adjusting screw about 1/4 of its full turn counter clockwise. (Since 1 pitch of the adjusting screw refers to 0.8 mm, the thrust clearance thus created becomes 0.1 mm to 0.3 mm.)

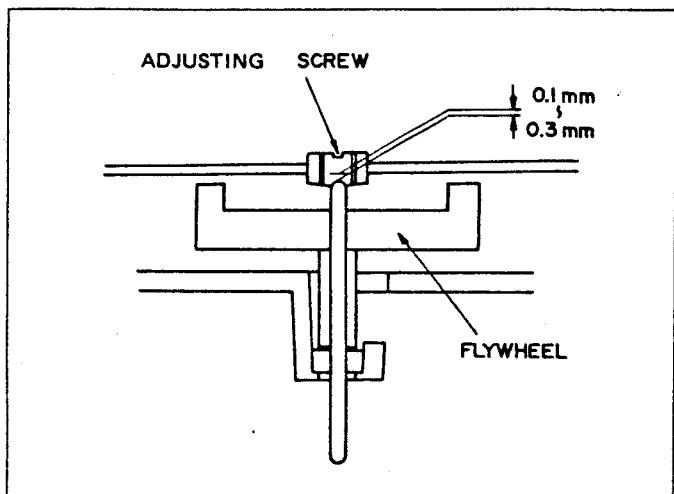

Figure 13

■ PINCH ROLLER PRESSURE ADJUSTMENT

(Refer to Figure 14)

1. Set the unit in PLAY mode.
2. Push the point **(A)** with a tension gauge (0 gr. to 500 gr.) to make the pinch roller apart from the flywheel shaft. Then, check that the tension gauge will read 300 gr. to 400 gr. when the pinch roller stops to rotate.
3. As a result of the check in the step 2 above, if the reading is found outside the range of 300 gr. to 400 gr., adjust the pressure spring of pinch roller by bending it or replace.

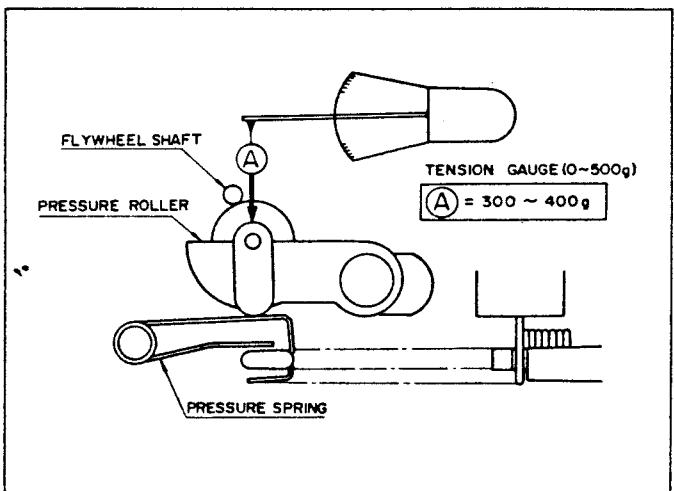

Figure 14

■ OPERATION CHECK OF FWD-APSS AND REV-APSS MECHANISMS

(Refer to Figures 40 and 41, Pages 31 and 32)

Under PLAY mode, slowly push the FWD-APSS key or REV-APSS key to make sure that the pinch roller (74) and the take-up idler (16) come off respectively from the flywheel shaft and the take-up turntable (65), and simultaneously the sub-chassis (09) moves 1 mm to 1.5 mm, and further that thereafter, the roller assembly (73) is pressed against the take-up turntable (65) or the supply turntable (66). Moreover, when the FWD-APSS key or REV-APSS key is released by pushing the FF (CUE) key or the REWIND (REVIEW) key, make ascertain that the sub-chassis (09) is reset and the unit gets in PLAY mode.

■ TORQUE MEASUREMENT AT PLAY, FF AND REWIND MODES

(Refer to Figure 15)

1. Mount a torque measuring reel on the turntable (that is, it is placed on the take-up turntable at PLAY/REWIND mode while on the supply turntable at REWIND mode).
2. Then gradually release the tension gauge and read it when the rotational speed of the turntable becomes almost constant.
3. Measured torques at each mode should be as tabulated below.

Note: When the take-up turntable is stopped at PLAY mode, there should be no slip between the take-up turntable and take-up slip roller and/or between the drive belt and take-up slip roller.

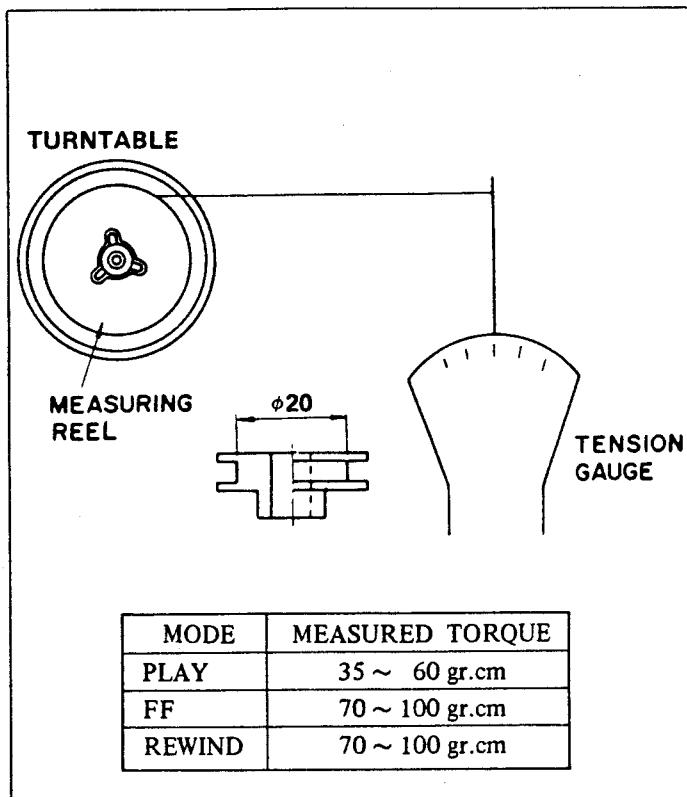

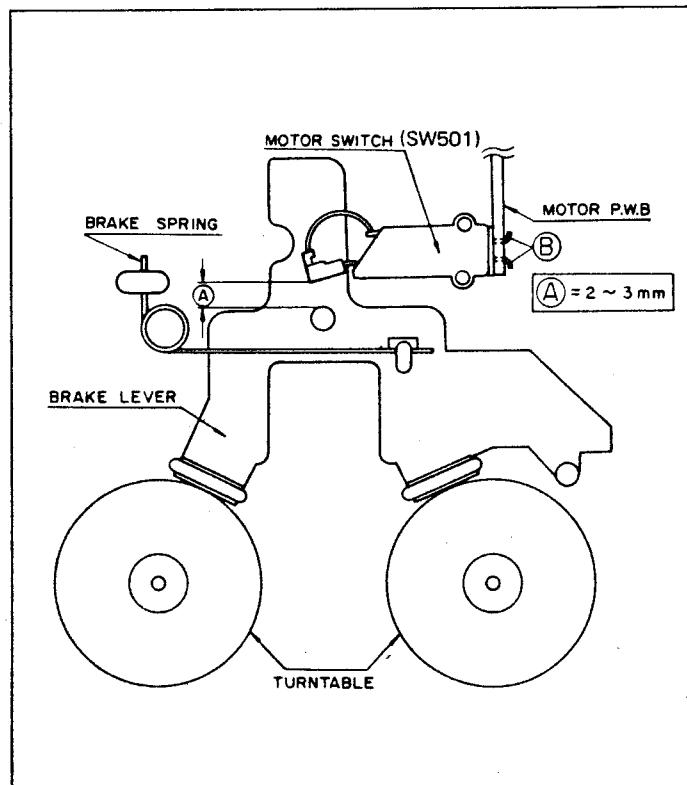

Figure 15

■ GAP ADJUSTMENT BETWEEN MOTOR SWITCH AND BRAKE LEVER

(Refer to Figure 16)

1. Under each of PLAY, FF, and REWIND modes, make ascertain that the motor switch (SW501) is turned "ON" without fail.
2. When the motor is in a stop, check that the gap (A) between the brake lever and the motor switch (SW501) is 2 mm to 3 mm.
3. If the steps 1 and 2 above are still insufficient for the adjustment, the gap can be adjusted by positionally changing the two soldered terminals (B) of motor switch (SW501) located at the motor PWB with a soldering iron.

■ OPERATION CHECK OF PAUSE MECHANISM

(Refer to Figure 40, Page 31)

Set the unit in PLAY mode by pushing the key given a mark (◀). Then slowly push the PAUSE key and make ascertain that the take-up idler (16) and the pinch roller (74) come off respectively from the take-up turntable (65) and the flywheel shaft almost at the same time and check that each of the two gaps thus produced is about 0.5 mm.

Figure 16

■ ADJUSTMENT OF PLUNGER SETTING POSITION

(Refer to Figure 17)

1. Under FF mode, loosen the plunger retaining screw, hold up the part **(A)** of the plunger by hand and while keeping the plunger in contact with the lock shaft, retighten the plunger retaining screw.
2. After the step 1, make sure of the following.
 - Check that each of the PLAY, FF (CUE), REWIND (REVIEW) keys can be locked smoothly.
 - Check that the FWD-APSS key and REV-APSS key can be locked smoothly and they further be released when the plunger operates.
 - Check that the plunger can start to operate smoothly when the STOP key is pushed to release the APSS keys.
3. After the step 2, the adjustments are not yet sufficient, again carry out the step 1.

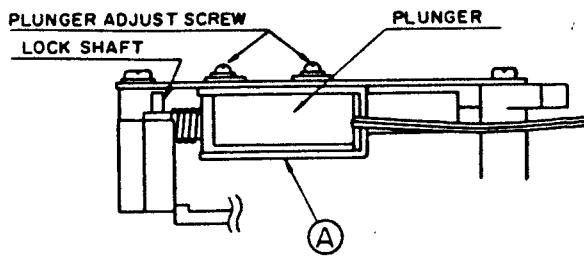

Figure 17

ELECTRICAL MEASUREMENT

- * This unit operates on DC 15V. Check that the power supply is exactly 15V before measurement.
- * Set the POWER switch (SW101F) to "TAPE" position.
- * Refer to Figure 33.

■ RECORD OSCILLATOR BIAS CURRENT AND BIAS FREQUENCY ADJUSTMENT

(Refer to Figure 18)

1. Connect the V.T.V.M. across the 100 ohm resistors (R115, R116).
2. Place the unit in RECORD mode.
3. Adjust the semi-variable resistors (R301, R302) so that the V.T.V.M. reads 50 mV for the right channel (R115) and left channel (R116) respectively.
4. Make sure the record oscillator bias frequency is 53 ± 3 kHz.
5. As a result of the check in the step 5 above, if the reading is found outside the 53 ± 3 kHz, adjust the bias oscillation coil (L301)
6. After the step 5, again make sure of the bias current.

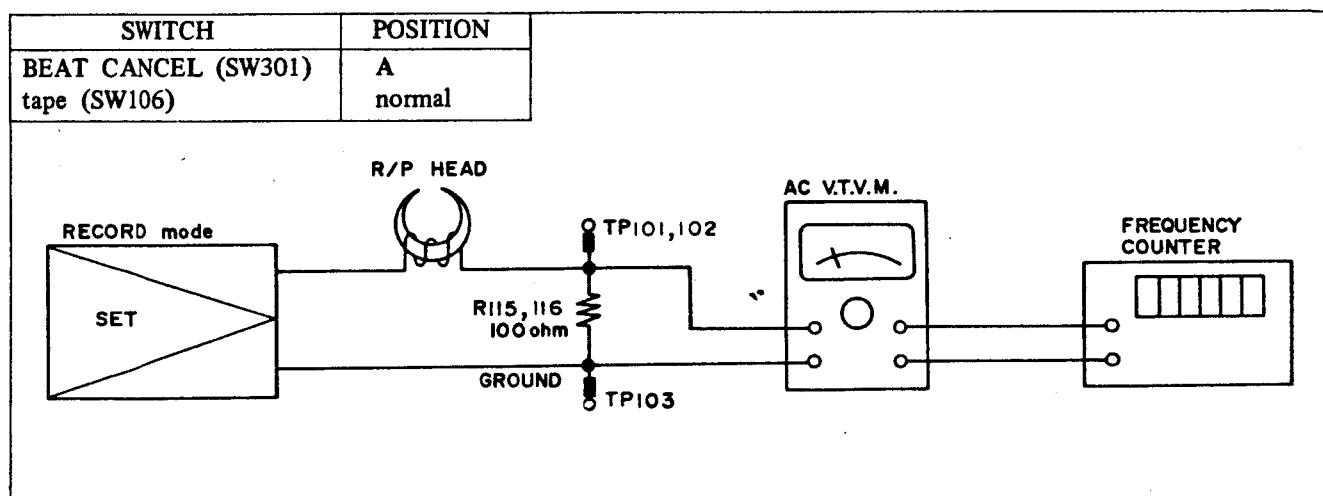

Figure 18

■ ERASE CURRENT CHECK

(Refer to Figure 19)

1. Connect the V.T.V.M. across the 1 ohm resistor (R303).
2. Place the unit in RECORD mode.
3. Make sure the erase current is 100 ± 20 mV.

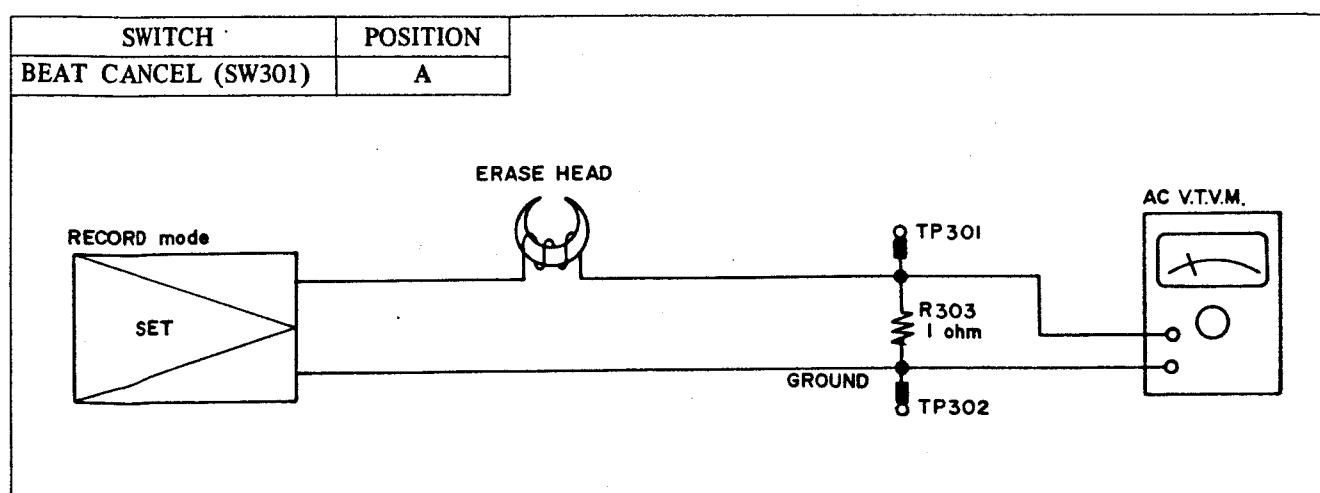

Figure 19

■ RECORD AMPLIFIER SENSITIVITY CHECK

(Refer to Figure 20)

1. Connect the V.T.V.M. across the 100 ohm resistors (R115, R116).
2. Short circuit the primary coil of the oscillation coil (L301) to stop bias oscillator.
3. Connect the signal generator to the EXT MIC jacks (J101-A, J101-C) and apply signal (1000 Hz, -78 dB) to the unit.

4. Place the unit in RECORD mode.

5. If the record amplifier sensitivity is normal, the reading on V.T.V.M. should be approximately 1.75 mV.

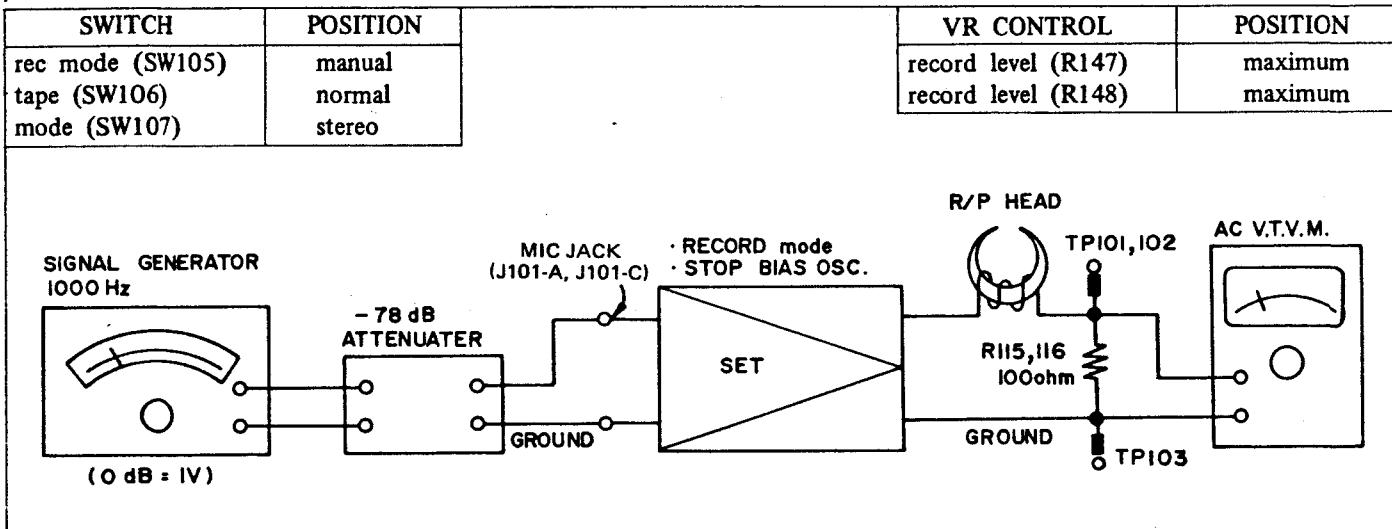

Figure 20

■ PLAYBACK AMPLIFIER SENSITIVITY CHECK

(Refer to Figure 21)

1. Connect load resistor (4ohm) to the EXT. SP sockets (SO102, SO103) and further connect the V.T.V.M. thereto.
2. Connect the signal generator in series of the REC/PB head and apply signal (1000 Hz, -80 dB) to the unit.

3. Place the unit in PLAYBACK mode.

4. If the playback amplifier sensitivity is normal, the reading on the V.T.V.M. should be approximately 1.0 V.

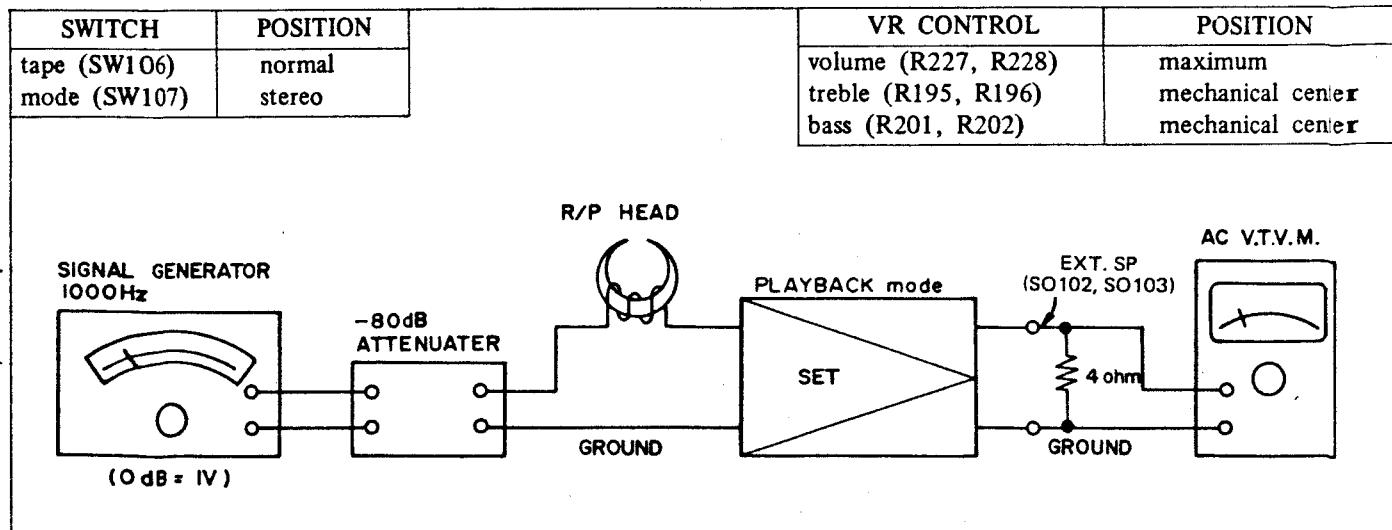

Figure 21

■ PHONO AMPLIFIER SENSITIVITY CHECK

(Refer to Figure 22)

1. Connect load resistor (4ohm) to the EXT. SP sockets (SO102, SO103) and further connect the V.T.V.M. thereto.
2. Connect the signal generator to the phono jacks (J103-A, J103-B) and apply signal (1000 Hz, -54 dB) to the unit.

3. Place the unit in PHONO mode.

4. If the phono amplifier sensitivity is normal, the reading on the V.T.V.M. should be approximately 2.8 V.

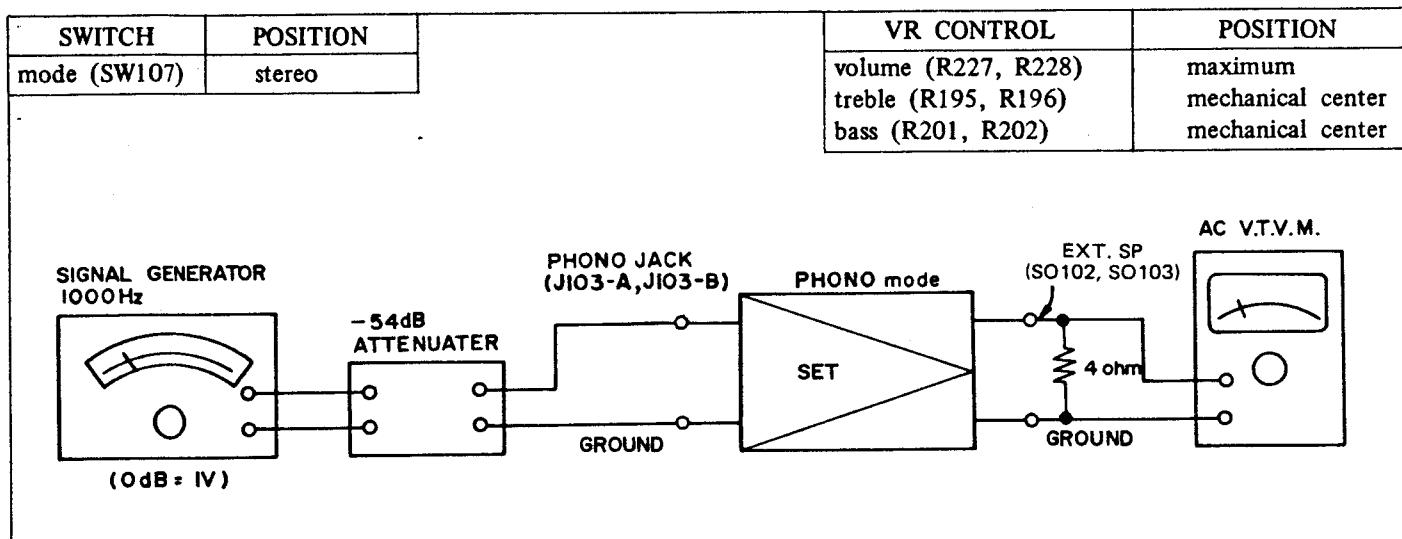

Figure 22

■ SWING ADJUSTMENT OF VU METER

(Refer to Figures 20 and 23)

1. Apply signal (1 kHz, -60 dB) to the EXT. MIC jacks (J101-A, J101-C)
2. Adjust the record volume controls (R147, R148) so that the V.T.V.M. reads 3.5 mV.
3. Rotate the semi-variable resistors (R187, R188) to adjust so that each of the two VU meters (ME101, ME102) indicates around "0" VU and swings to the same extent in right and left of the position "0" VU.

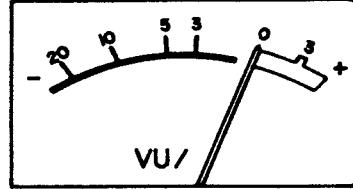

Figure 23

■ RECORD/PLAYBACK HEAD AZIMUTH ADJUSTMENT

(Refer to Figure 24.)

1. Connect load resistor (4ohm) to the EXT. SP sockets (SO102, SO103) and connect outputs of both the right and left channels to the vertical and horizontal input terminals of oscilloscope.
2. Insert the test tape (MTT-114, 10 kHz, -10 dB Recorded).
3. Place the unit in PLAYBACK mode.
4. Adjust the head azimuth adjusting screw so that Lissajou's waveform attains the maximum and the same phase in right and left.

5. Even without using the oscilloscope, also adjust the head azimuth adjusting screw so that outputs of both the right and left channels attain the maximum and the same phase in right and left, and as a result, the output won't be decreased so much considerably even when the mode switch (SW107) is set to "mono".

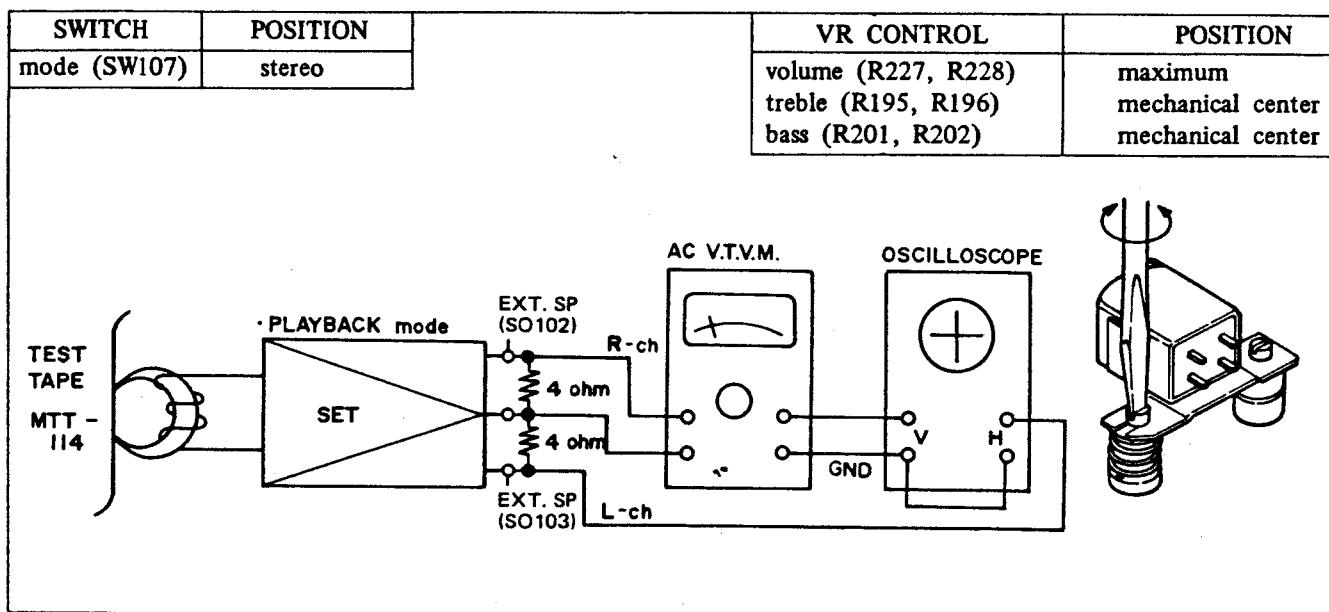

Figure 24

GENERAL ALIGNMENT INSTRUCTION

Should it become necessary at any time to check the alignment of this receiver, proceed as follows;

1. Set the volume control (R227, R228) to maximum.
2. Attenuate the signals from the generator enough to swing the most sensitive range of the output meter.

3. Use a non-metallic alignment tool.
4. Repeat adjustments to insure good results.
5. Set the POWER switch (SW101F) to "ON" position.

THE INSTRUCTION OF FREQUENCY ADJUSTMENT (GF-9191H/HB)

In order to comply with FTZ rule: Nr. 358/1970, please fix the low end of dial frequency (87.5MHz) and the high end of dial frequency (107.9MHz) on FM band, by adjust-

ing oscillation coils (L3 and L4) and oscillation trimmer (TC2), respectively, as illustrated in Figure 33.

AM ALIGNMENT CHART

(Refer to Figure 33)

STEP	BAND	TEST STAGE	SIGNAL GENERATOR		RECEIVER		ADJUSTMENT
			CONNECTION TO RECEIVER	INPUT SIGNAL FREQUENCY	DIAL SETTING	REMARKS	
1	MW	IF	Refer to Figure 25	Exactly 455 kHz. (400 Hz, 30%, AM modulated)	High end of dial. (minimum capacity)	Adjust for maximum output.	Adjust the AM IF transformers (T3) (T4)
2	MW		Refer to Figure 25	Exactly 510 kHz. (400 Hz, 30%, AM modulated)	Low end of dial. (maximum capacity).	Adjust for maximum output.	Adjust the MW oscillation coil (L9).
3	MW	Band Coverage	Same as step 2.	Exactly 1650 kHz. (400 Hz, 30%, AM modulated)	High end of dial. (minimum capacity).	Same as step 2.	Adjust the MW oscillation trimmer (TC7).
4	MW		Same as step 2.	Exactly 600 kHz. (400 Hz, 30%, AM modulated)	600 kHz.	Same as step 2.	Adjust the MW antenna coil (L7) (See Note A)
5	MW	Tracking	Same as step 2.	Exactly 1400 kHz. (400 Hz, 30%, AM modulated)	1400 kHz.	Same as step 2.	Adjust the MW antenna trimmer (TC4). (See Note A)
6	MW		Repeat steps 2, 3, 4, and 5 until no further improvement can be made.				
7	LW		Same as step 2.	Exactly 145 kHz. (400 Hz, 30%, AM modulated)	Low end of dial. (maximum capacity)	Same as step 2.	Adjust the LW oscillation coil (L10).
8	LW	Band Coverage	Same as step 2.	Exactly 295 kHz. (400 Hz, 30%, AM modulated)	High end of dial. (minimum capacity)	Same as step 2.	Adjust the LW oscillation trimmer (TC8).
9	LW		Same as step 2.	Exactly 160 kHz. (400 Hz, 30%, AM modulated)	160 kHz.	Same as step 2.	Adjust the LW antenna coil (L7)-
10	LW	Tracking	Same as step 2.	Exactly 260 kHz. (400 Hz, 30%, AM modulated)	260 kHz.	Same as step 2.	Adjust the LW antenna trimmer (TC5).
11	LW		Repeat steps 7, 8, 9 and 10 until no further improvement can be made.				
12	SW		Refer to Figure 26	Exactly 5.85 MHz (400 Hz, 30%, AM modulated)	Low end of dial. (maximum capacity)	Same as step 2.	Adjust the SW oscillation coil (L8).
13	SW	Band Coverage	Same as step 12.	Exactly 18.5 MHz. (400 Hz, 30%, AM modulated)	High end of dial. (minimum capacity)	Same as step 2.	Adjust the SW oscillation trimmer (TC6).

14	SW	Tracking	Same as step 12.	Exactly 6.5 MHz. (400 Hz, 30%, AM modulated)	6.5 MHz	Same as step 2.	Adjust the SW antenna coil (L6).
15	SW		Same as step 12.	Exactly 16 MHz (400 Hz, 30%, AM modulated)	16 MHz	Same as step 2.	Adjust the SW antenna trimmer (TC3).
16	SW	Repeat steps 12, 13, 14 and 15 until no further improvement can be made.					

Note A Check the alignment of the receiver antenna coil by bringing a piece of ferrite (such as a coil slug) near the antenna loop stick, then a piece of brass. If ferrite increases output, loop requires less inductance. Change loop inductance by sliding the bobbin toward the center of ferrite core to increase inductance, or away to decrease inductance. If brass increases output, loop requires more inductance.

output, loop requires less inductance. Change loop inductance by sliding the bobbin toward the center of ferrite core to increase inductance, or away to decrease inductance.

Note B (Refer to Figure 29)

There are 5 kinds of ceramic filters (CF101, CF102) available with this unit and they are given color indication as tabulated below to differentiate the central frequency from one to another among them. When using them, be sure to make the two of the same type a pair.

When other ceramic filters than the one (red) having the central frequency of 10.7 MHz are used, note that a marker (10.7 MHz) of FM sweep generator, if used, will be deviated - therefore, adjust the generator by putting off the marker.

Central frequency (f ₀)	D	Black:	10.64 MHz ± 30 kHz
	B	Blue:	10.67 MHz ± 30 kHz
	A	Red:	10.70 MHz ± 30 kHz
	C	Orange:	10.73 MHz ± 30 kHz
	E	White:	10.76 MHz ± 30 kHz
